

Access control & identity management

The high-performance readers from the Secustos line can be used flexibly for a wide range of access control applications both indoors and outdoors.

Security meets flexibility: sesamsec sets new standards in access control and identity management with expertise, innovation and a deep understanding of the challenges faced by its customers and partners.

In view of the increasing networking of buildings, access control is becoming more and more important as an indispensable element of a comprehensive security concept. Here, sesamsec has specialized in tailor-made solutions that meet the highest security standards and individual requirements of its customers: The access control readers in the Secustos family, for example, are versatile readers that feature RFID, NFC and BLE technologies and can be seamlessly integrated into any environment.

Everything coordinated. Everything according to your project requirements.

The high-performance readers in the Secustos family provide the basis for an advanced and future-proof access control solution that combines security and flexibility. They not only regulate access, but can also be intelligently integrated into the overall concept of modern building security. The readers are universal devices; they support practically any LF or HF RFID transponder technology as well as mobile credentials that use Near-Field Communication (NFC) or Bluetooth® Low Energy (BLE). This means that currently used technologies can continue to be used and integrated into a flexible and future-proof solution. In addition,

sesamsec offers complete solutions that can be individually adapted to the needs of its customers and are perfectly coordinated to optimally meet the specific requirements of a project.

PACaaS and Professional Services: Cloud-based models with maximum flexibility

The popularity of SaaS (Software as a Service) models is steadily increasing in companies and organizations. Even in the area of access control, complex and costly in-house solutions could be a thing of the past. From cloud-based tools for "Physical Access Control-as-a-Service" (PACaaS) to a partner portal—Secustos readers are supported by a comprehensive range of professional services that facilitate installation, configuration and administration. This concept offers numerous advantages, such as greater flexibility and cost efficiency. In addition, the services adapt seamlessly to the growth of the business and enable effortless scaling according to changing requirements. Instead of a high initial investment, companies only pay for the use of sesamsec services depending on the size of the system—a spectrum ranging from co-working offices to large chain stores. The initial setup and basic configuration of the application is done in a few minutes with a click and can be optimally adapted to the needs and processes of the end user.

sesamsec partnerships: Security, flexibility and professional support

sesamsec provides unparalleled partner support to ensure effortless implementation of the access solution. By qualifying as a sesamsec partner, companies can optimize their market position and redefine the world of access control with cloud-based solutions. The partnership offers numerous benefits such as greater flexibility, scalability, faster implementation of new technologies, professional support and greater growth potential, to name just a few of the key advantages that companies can benefit from when using these services.

Carsten Hoersch, Managing Director of sesamsec GmbH, underlines this approach:

"For sesamsec, security comes first. Our innovative access control solution is designed to maximize flexibility and user-friendliness because we believe that security should be customized and scalable to meet the unique requirements of each customer. Our Secustos line and our PAC-as-a-Service offering demonstrate our commitment to providing secure, user-friendly and future-proof solutions from a single source for our customers and partners."
